Subject: National Broadband Network Submission

Regarding the National Broadband Network, it is imperative that any new system be fibre to house, not just fibre to node, which is what all of the plans offered so far have offered. For those of us in metro areas, where most of the population lives, it is node to house wiring that is causing the problem. Telstra installed substandard RIM and PGS wiring to our houses and continues to do so today in new developments, so it is no different than building an eight-lane freeway that ends at a cliff face. My next door neighbour, whose house was better wired by Telstra, already has ADSL2, so he and the millions like him don't particularly care about a new service. It is the rest of us who need help, and any idea of giving us WiMax instead is an insult and a betrayal of those who put the current government in office.
